

Home Assignment 1 - n8n Template Exploration

Objective

Explore an n8n template, understand the workflow, replace the OpenAI model with Groq, execute the workflow successfully, and document the learning.

Original Template from n8n

The screenshot shows the n8n.io website with a workflow template titled "Analyze Landing Page with OpenAI and Get Optimization Tips". The workflow diagram includes the following steps:

- Landing Page Url**: The starting trigger node.
- Scrape Website**: A node that fetches content from the provided URL.
- AI Agent**: A node that processes the scraped content. It is connected to a **Chat Model*** node, which in turn is connected to an **OpenAI Chat Model** node.
- Memory** and **Tool**: Additional nodes connected to the AI Agent for context and functionality.

The template is created by "Not Another Marketer" and includes a promotional message: "Your Landing Page is Leaking Sales—Here's How to Fix It in Seconds". The n8n logo and navigation menu are visible at the top of the page.

Workflow Executed Successfully using Groq Chat Model

Workflow

Landing Page URL → Scrape Website → AI Agent → Groq Chat Model → AI Suggestions

Changes Made

The original workflow used OpenAI. Since an OpenAI API key was unavailable, the Chat Model was replaced with Groq (llama-3.3-70b-versatile).

Execution Result

Input URL: <https://example.com>
Execution Status: Success
Execution Time: ~6.7 seconds
Total Tokens: 1542

Challenges

Apple Store generated ~260K tokens and exceeded the model context window. Switched to <https://example.com> for successful execution.

Learning Outcomes

- Understood workflow architecture.
- Learned Input → Processing → Output.
- Understood AI Agent vs Chat Model.
- Learned Groq integration.
- Learned context window limitations.
