

Scenario Name	Amazon User Registration API
Weak Prompt	Write API test cases for user registration.
What I Feel is Missing	• Application/domain context • API endpoint and HTTP method • Authentication requirements (if applicable) • Request payload structure • Mandatory and optional fields • Business validation rules • Expected request/response format • HTTP status codes to validate • Success and error response details • Positive, Negative, Edge, Security and Non-Functional coverage • Tool/framework context (Postman / REST Assured) • Expected output format
Instruction	Generate comprehensive positive, negative, edge, security, and non-functional API test cases covering all User Registration functionalities of the Amazon application.
Context	The application is Amazon. The User Registration API allows new users to create an account using mandatory fields such as Email ID, Mobile Number, and Password, while User Name and Country are optional. The password must contain at least 8 characters, including one uppercase letter, one lowercase letter, one numeric digit, and one special character. Duplicate email IDs and mobile numbers are not allowed. Missing mandatory fields should return validation errors. Successful registration should return an appropriate HTTP status code, a success message, a system-generated User ID, and an authentication token if applicable.
Example	API_TC_001 Test Description: Verify that a new user can successfully register with valid details. Test Data: Email: john@example.com, Mobile: 9876543210, Password: Test@1234 Expected Result: API returns HTTP 201 Created, success message, system-generated User ID, and authentication token (if applicable).

Persona	Act as a Senior QA Automation Architect with 10+ years of experience specializing in E-commerce API Testing, REST Assured, Postman, API Automation, Security Testing, and comprehensive API test case design.
Output Format	Test Case ID API Endpoint HTTP Method Test Scenario Preconditions Request Payload Expected HTTP Status Code Expected Response Actual Test Results Status Comments
Tone	Professional
Rewritten Prompt	Persona: Act as a Senior QA Automation Architect with 10+ years of experience specializing in E-commerce API Testing, REST Assured, Postman, API Automation, Security Testing, and comprehensive API test case design. Context: Amazon User Registration API with mandatory Email ID, Mobile Number and Password, defined password rules, duplicate email/mobile validation, and proper success/error responses. Instruction: Generate comprehensive positive, negative, edge, security, and non-functional API test cases covering request validation, business rules, HTTP status code validation, response validation, and error handling. Example: API_TC_001 – Verify successful registration using valid user details. Expected: HTTP 201 Created with success message, User ID, and authentication token. Output Format: Test Case ID API Endpoint HTTP Method Test Scenario Preconditions Request Payload Expected HTTP Status Code Expected Response Actual Test Results Status Comments Tone: Professional

Observations	1. The rewritten prompt provides complete API business context and removes ambiguity. 2. The persona guides the AI to think like an experienced API QA Automation Architect. 3. The context enables broader functional and business validation coverage. 4. The example improves consistency in generated API test cases. 5. The output format ensures structured and readable results. 6. The rewritten prompt generates enterprise-ready API test cases compared to the weak prompt.
