

Scenario Name	Shopping Cart Functionality
Weak Prompt	Test the cart functionality.
What I Feel is Missing	• Application name • User roles (Guest / Registered / Prime) • Cart operations (Add, Remove, Update Quantity) • Cart limitations • Product validation rules • Pricing validation • Wishlist functionality • Checkout validation • Cart badge/count synchronization • Session behavior • Validation rules and business rules • Success and error messages • Edge case scenarios • Security validations • Non-functional requirements
Instruction	Generate comprehensive positive, negative, edge, integration, security, and non-functional test cases covering all Shopping Cart functionalities of the Amazon web application.
Context	The application is Amazon. The Shopping Cart functionality is available for Guest Users, Registered Users, and Prime Members. Users can browse products, add items to the shopping cart, update quantities, remove items, save items for later, move items to the wishlist, apply coupons or promotional discounts, and proceed to checkout. The cart should accurately calculate the subtotal, taxes, shipping charges, discounts, cashback, reward points (if applicable), and the final payable amount. The system should validate product availability, stock limits, purchase quantity limits, and pricing changes before checkout. The shopping cart should synchronize the cart count across the application, retain cart data based on the user session, and display appropriate success or error messages for all cart operations. The shopping cart should provide a secure, responsive, and consistent user experience across supported browsers and devices.

Example	TC_001 Test Description: Verify that a registered user can successfully add an in-stock product to the shopping cart. Test Data: Apple iPhone 16 (In Stock), Quantity: 1 Expected Result: The product should be added successfully, the cart count should be updated, and a confirmation message should be displayed.
Persona	Act as a Senior Software QA Engineer with 12+ years of experience specializing in eCommerce web application testing, test case design, and automation testing.
Output Format	Test Case ID Module Scenario Preconditions Test Data Test Steps Expected Result Actual Test Results Status Comments
Tone	Professional

Rewritten Prompt	Persona: Act as a Senior Software QA Engineer with 12+ years of experience specializing in eCommerce web application testing, test case design, and automation testing. Context: The application is Amazon. The Shopping Cart functionality is available for Guest Users, Registered Users, and Prime Members. Users can browse products, add items to the shopping cart, update quantities, remove items, save items for later, move items to the wishlist, apply coupons or promotional discounts, and proceed to checkout. Instruction: Generate comprehensive positive, negative, edge, integration, security, and non-functional test cases covering all Shopping Cart functionalities of the Amazon web application. Example: TC_001 – Verify that a registered user can successfully add an in-stock product to the shopping cart. Test Data: Apple iPhone 16 (In Stock), Quantity: 1 Expected Result: The product should be added successfully, the cart count should be updated, and a confirmation message should be displayed. Output Format: Test Case ID Module Scenario Preconditions Test Data Test Steps Expected Result Actual Test Results Status Comments Tone: Professional
-------------------------	---

Observations	1. The rewritten prompt provides complete business context and removes ambiguity. 2. The persona guides the AI to think like an experienced Senior QA Engineer. 3. The context enables broader business coverage. 4. The example improves consistency in generated test cases. 5. The output format ensures structured and readable results. 6. The rewritten prompt generates enterprise-ready test cases compared to the weak prompt.
